Software

Offline Programming Software

WINCAPS Plus

DENSO

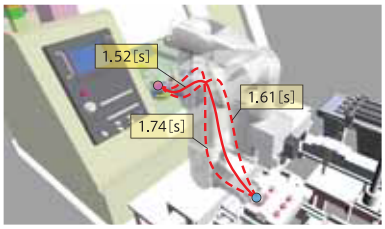

Features

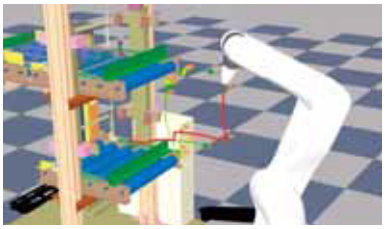

3D Visual Programming

By embedding commands such as flow control statements (conditional branching) in the robot's path, programming can be performed while visually grasping the robot's movement, making it easy for users who are not familiar with programming language to program.

Optimized Motion Planner

By specifying the start and end points of the robot's motion, the system will automatically generate a path that avoids obstacles and has the shortest cycle time. The robot's path design, which used to rely on the experience of the user, can be generated scientifically so that both skilled and novice users can operate the robot with the same performance.

Home Position Guidance

Assuming that the path taken by the robot during automatic operation is safe, with no obstacles, the system generates a path that allows the robot to safely return to the origin from the operation path that was automatically collected.

*If you are using RC8, a separate dedicated IPC is required.

Robot Viewer

Robot Viewer is a 3D viewer that can be used with WINCAPS Plus. It provides a comfortable simulation environment for the WINCAPS Plus product line with enhanced 3D CAD data loading, an object operation environment, and object management.

Palletizing Builder

This software is used in the palletizing/depalletizing process. The shape and dimensions of pallets and loads on the software are input, then automatic calculation is performed and the target position is displayed considering the movable range.

Supported languages

Japanese, English, German, Korean, Chinese
